PROJECT PORTAL WORKFLOW MANAGEMENT

Feature Overview and Lifecycle Summary

A concise guide to the portal's main features, user responsibilities, and complete operational lifecycle.

Version 4.0 | Feature-focused edition

Document Scope

This document gives an overall understanding of what the Project Portal Workflow Management system does. It focuses only on the main features and the lifecycle of bids, projects, work requests, documents, reviews, revisions, and client decisions. Detailed technical implementation is intentionally excluded.

Feature Areas

Area	Main purpose
Dashboard	Shows workload, active records, priority submissions, shortcuts, and recent activity.
Projects / Bids	Creates and manages commercial bids and active projects.
Work Requests	Controls each engineering deliverable from creation to final acceptance.
Workflow Actions	Routes work between CCR, PMO/ECM, TMS, and Client roles.
Documents	Organizes files by project, document category, date, version, and revision.
Notifications	Shows role-specific tasks and opens the exact record requiring action.
Organization & Teams	Maintains companies, divisions, teams, leads, and members.
Settings	Maintains the controlled lists used throughout the portal.

Main Operating Flow

A bid or project is created, one or more work requests are added, each work request passes through preparation and engineering review, the final package is delivered to CCR and then to the Client, and the result becomes accepted, rejected, or returned for revision.

1. Roles and Global Portal Features

The portal shows each user only the records and actions relevant to their role, assignment, division, and current workflow stage.

Role	Main responsibility
System Admin	Oversees the entire portal and can access all records and management areas.
Prime Consultant	Supervises projects and workflows with broad operational access.
CCR Coordinator / CCR Marketing	Creates bids, projects, and work requests; coordinates delivery to and from the Client.
PMO / ECM Division Lead	Assigns division members, reviews their work, and forwards accepted work to engineering.
PMO / ECM Division Member	Prepares assigned deliverables and responds to information or revision requests.
TMS Manager	Assigns M1, M2, and M3 engineering responsibilities and manages engineering revisions.
TMS-M1	Prepares or updates drawings and engineering documents.
TMS-M2	Checks M1 submissions and approves or returns them for correction.
TMS-M3	Performs final engineering approval or requests further revision.
Client / Owner	Reviews submitted packages and accepts, rejects, or requests revision.

Global Application Shell

Main perspective: Provides one consistent workspace for all portal modules.

- Fixed sidebar navigation with role-based menu visibility.
- Top header with current user context and notification access.
- Active page highlighting and direct navigation to selected records.
- Responsive sidebar behavior for desktop and smaller screens.
- Success, warning, and error feedback after user actions.

2. Dashboard Features

The Dashboard is the operational home screen. It summarizes the user's accessible portfolio and highlights the work that requires immediate attention.

KPI Summary

Main perspective: Provides a quick numerical view of current business activity.

- Active Engineering Projects count.
- Active Bids / Proposals count.
- Pending Reviews count.
- Approved Documents count.
- Values are calculated from the records visible to the current role.

Quick Access

Main perspective: Opens the main operational areas without searching through menus.

- Folder-style shortcuts for Active Projects, Active Bids, Work Requests, and Documents.
- Each shortcut opens the matching workspace or filtered list.

Quick Actions

Main perspective: Lets authorized users start frequent tasks directly from the Dashboard.

- Create Bid / Project.
- Create Work Request.
- Open Projects / Bids.
- Open Work Requests.
- Open Documents.
- Only actions allowed for the current role are displayed.

Critical Submissions

Main perspective: Shows work requests waiting for the current user or role.

- Displays request identity, parent project/bid, status, priority, assignment, and latest activity.
- Opens the selected work request directly for review or action.

Activity Trail

Main perspective: Provides a recent history of important workflow movement.

- Shows actor, action, record, previous stage, new stage, date, and comment.
- Helps users understand what changed and who performed the change.

Dedicated Bid and Project Workspaces

Main perspective: Gives a focused view of one selected bid or project.

- Summarizes record information, progress, documents, and related work requests.
- Allows users to open details, upload files, or continue the workflow.

3. Projects and Bids Features

Projects and Bids are managed in one register because they share clients, documents, work requests, workflow progress, and lifecycle decisions.

Projects / Bids Register

Main perspective: Provides a searchable view of all accessible commercial and project records.

- Search by name, project code, bidding number, or client.
- Filter by record type and status.
- Display code, name, client, status, progress, and work-request count.
- Use the action menu to open details, workflow, upload, creation, or decision actions.

Create Bid / Project

Main perspective: Creates the parent record for all related work.

- Select Bid or Project.
- Choose the client and show the registered client email.
- Record project/bid name, source, ports, cargo, vessel, shipment, and document information.
- Generate the parent code and root folder name.
- Upload initial intake documents.
- A Bid starts in the bidding lifecycle; a direct Project starts as active.

Record Details

Main perspective: Shows the main information and files for the selected record.

- Business identity and client.
- Current type, status, and progress.
- Related documents and work requests.
- Available actions based on role and status.

Workflow Access

Main perspective: Connects a parent record to its work requests.

- View Workflow opens the related work-request workspace.
- When no work request exists, the portal shows a warning instead of opening an empty workflow.

Bid Decision

Main perspective: Completes the commercial outcome after all related work is accepted.

- Assign converts the bid into an active project.
- Reject archives the bid.
- Archived bids can be returned for another client review when authorized.

4. Work Request and Workflow Action Features

A Work Request is the main executable unit of the portal. Every engineering deliverable is managed as a separate request under one Bid or Project.

Work Request List

Main perspective: Organizes all deliverables under their parent record.

- Group or filter requests by project/bid, status, priority, and assignment.
- Show request code, title, type, current stage, responsible role/member, and latest activity.
- Open details, upload documents, view history, or perform available actions.

Create Work Request

Main perspective: Defines a new deliverable and its starting route.

- Select an eligible parent Bid or active Project.
- Enter title, work-request type, priority, attachment category, assigned division, instructions, and initial files.
- The request begins under CCR coordination and is prepared for division routing.

Work Request Details

Main perspective: Presents the complete operational record.

- Parent information, priority, instructions, assignments, current status, documents, information requests, transfer history, and revision history.
- Preview or download related files.

Workflow Action Center

Main perspective: Displays only valid next actions for the current user and stage.

- Assign division lead or member.
- Request or provide information.
- Submit, approve, reject, or request revision.
- Assign TMS-M1, M2, and M3.
- Submit final package to CCR or Client.
- Accept, reject, or request client revision.
- Each action updates the status, responsibility, notification queue, and history.

Transfer and Revision History

Main perspective: Explains how the request moved and why it returned.

- Transfer History records each handoff between roles or members.
- Revision History records revision reason, requester, response, files, and revision cycle.

5. Document and Notification Features

Document Explorer

Main perspective: Provides a business-structured file system for all project and bid records.

- Navigate through Bids or Projects, parent root folder, document category, date/revision folder, and files.
- Use breadcrumbs, folder tree, search, grid view, or list view.
- Upload one or multiple files into the selected record.
- Preview image, PDF, and supported text files; download any accessible file.

Automatic File Organization

Main perspective: Maintains consistent naming and revision control.

- Uses project/bid code, cargo code, vessel code, shipment number, document code, document name, upload date, version, and revision code.
- Keeps intake, collaboration, engineering, marketing, client, and accepted documents under the same parent structure.
- Identifies the latest version of each document for final-package selection.

Document Versioning

Main perspective: Preserves document history while allowing updated submissions.

- Initial files begin with the first version.
- New uploads of the same logical document create a higher version.
- Revision actions create a revision record and associated files.
- Final accepted files remain visible as the completed output.

Header Notifications

Main perspective: Shows current tasks from anywhere in the portal.

- Notification bell displays unread count and recent role-specific items.
- Users can mark one item or all items as read.
- Clicking a notification opens the exact related project, bid, or work request.

Notification Center

Main perspective: Provides the complete action queue for the selected actor.

- Includes assignment, submission, approval, rejection, information request, revision, and client-response notifications.
- Filters notifications according to role, assignment, and participation.

6. Organization, Teams, and Settings Features

Companies and Divisions

Main perspective: Maintains the organization structure used for routing and assignment.

- View registered companies and their divisions.
- Add a company.
- Add a division under a selected company.
- Use divisions when creating teams and routing work requests.

Teams and Members

Main perspective: Defines the people available for workflow assignments.

- Create teams under a company and division.
- Choose a team lead.
- Add members and assign their portal roles.
- Show assigned and unassigned members.
- Search teams and people.

Portal Settings

Main perspective: Controls the reusable values shown in forms and naming rules.

- Portal display name.
- Port of Loading and Port of Discharge lists.
- Cargo names and codes.
- Vessel names and codes.
- Marketing and engineering document names/codes.
- Work-request types.
- Project-information categories.
- Attachment categories.
- Add, remove, save, or restore default values.

Feature Relationship Summary

Feature	Connects to
Companies / Divisions	Teams, role assignments, and work-request routing.
Teams / Members	Division leads, members, TMS assignments, and notification recipients.
Settings	Creation forms, project codes, document folders, filenames, and categories.
Projects / Bids	Clients, documents, work requests, progress, and final decision.
Work Requests	Workflow actions, documents, notifications, revisions, and acceptance.

7. Overall Portal Lifecycle

The lifecycle connects commercial intake, project coordination, discipline preparation, engineering review, client delivery, and final acceptance in one continuous record.

1. Create Parent Record - CCR or an authorized user creates a Bid or active Project and uploads the initial documents.

2. Create Deliverables - One or more Work Requests are created under the parent record. Each request represents a specific deliverable.

3. Route to Division - The request is sent to PMO or ECM and assigned to a division lead and member.

4. Prepare and Review - The division member prepares the work. The lead accepts it, requests information, or returns it for revision.

5. Engineering Cycle - Accepted division work moves to TMS. M1 prepares drawings, M2 checks them, and M3 gives final engineering approval.

6. CCR Delivery Review - The approved engineering package returns to CCR/Marketing for final coordination and client delivery.

7. Client Decision - The Client accepts, rejects, or requests revision.

8. Complete or Re-enter Revision - Accepted work becomes a final listed output. Revision requests return to the correct responsible stage and repeat until accepted.

9. Parent Outcome - A completed Bid can be assigned as a Project or rejected and archived. Projects continue until all required work requests are completed.

Primary Responsibility Flow

Stage	Responsible party	Main output
Commercial intake	CCR / Marketing	Bid or project record and initial files.
Discipline preparation	PMO / ECM Lead and Member	Prepared work package.
Engineering production	TMS-M1	Drawing or engineering submission.
Engineering checking	TMS-M2	Checked submission or revision request.
Engineering approval	TMS-M3 / TMS Manager	Approved engineering package.
Client coordination	CCR / Marketing	Final package delivered to Client.
Final decision	Client / Owner	Acceptance, rejection, or revision request.

8. Bid and Project Lifecycles

8.1 Bid Lifecycle

1. Create the Bid with client, bidding details, project information, controlled codes, and intake documents.
2. Create every required deliverable as a separate Work Request under the Bid.
3. Complete each Work Request through division preparation, TMS engineering, CCR delivery, and Client acceptance.
4. When all related Work Requests are accepted, the Bid becomes ready for the commercial client decision.
5. Assign converts the Bid into an active Project while retaining its files, work requests, and history.
6. Reject archives the Bid and closes its current commercial lifecycle.
7. An authorized archive-review action can reopen the Bid for another client decision.

8.2 Project Lifecycle

8. A Project is created directly or produced by converting an accepted Bid.
9. The Project holds multiple Work Requests for different deliverables, disciplines, or document packages.
10. Each Work Request progresses independently, allowing some deliverables to be complete while others remain active.
11. Project progress reflects the number and state of its related Work Requests.
12. All project files remain grouped under the same generated root folder and document structure.
13. Each accepted Work Request creates a completed final output in the project record.
14. The Project remains active while additional work requests, revisions, or deliverables continue.

Bid-to-Project Conversion Result

Before conversion	After conversion
Record type: Bid	Record type: Project
Commercial bid code	Project code
Client decision pending	Active project workspace
Bid work requests	Same work requests linked to the Project
Bid documents and history	Retained without losing traceability

9. Complete Work Request Lifecycle

Step	Lifecycle stage	Overall behavior
1	Creation	CCR creates the request under a Bid or Project and selects division, priority, type, instructions, and initial files.
2	Division assignment	The PMO/ECM Lead receives the request and assigns the responsible division member.
3	Preparation	The member prepares the required deliverable and can request missing information.
4	Lead review	The division lead reviews the submission and either forwards it, requests information, or returns it for revision.
5	TMS assignment	The TMS Manager assigns M1, M2, and M3 responsibilities.
6	Drawing / engineering production	M1 creates or updates the drawing and submits it for checking.
7	Checking	M2 approves the submission or returns it to M1 for correction.
8	Final engineering approval	M3 approves the checked work or requests another engineering revision.
9	Engineering final review	The TMS Manager or Engineering Lead confirms the package and sends it to CCR.
10	CCR submission	CCR reviews the final package and submits it to the Client.
11	Client decision	The Client accepts, rejects, or requests revision.
12	Completion	Accepted work becomes a final listed document and remains connected to its parent Bid or Project.

Lifecycle Control Principles

- Only actions valid for the current status and role are displayed.
- Assignments determine which specific member can act.
- Every transition records the actor, time, comment, previous status, and next status.
- Each handoff creates a notification for the next responsible person or role.
- Uploaded files remain connected to the transition and revision in which they were submitted.
- Completion occurs only after the Client accepts the final package.

10. Supporting Lifecycles

10.1 Information Request Lifecycle

15. A user identifies missing information while preparing or reviewing a Work Request.
16. The request is sent to the appropriate lead, CCR, Client, TMS Manager, or assigned participant.
17. The recipient receives a notification and provides a response or supporting file.
18. The response is stored in the Work Request history.
19. The request returns to the stage from which the information was requested and normal work continues.

10.2 Revision Lifecycle

A revision does not create a separate Work Request. The same request returns to the responsible stage with its complete history preserved.

Revision source	Returns to	Then continues through
PMO/ECM Lead	Assigned PMO/ECM Member	Division lead review again.
TMS-M2	TMS-M1	M2 checking and M3 approval again.
TMS-M3	TMS-M1	Checking and approval again.
Engineering Lead	PMO/ECM or TMS, depending on issue	Relevant preparation and engineering stages again.
CCR / Marketing	Engineering team	Engineering approval and CCR delivery again.
Client / Owner	CCR, then PMO/ECM or TMS	Revised package is resubmitted to the Client.

10.3 Document Lifecycle

- Initial files are stored under the parent Bid or Project.
- Work files are added during preparation, review, checking, approval, and delivery.
- Updated copies increase the document version while keeping previous versions available.
- Revision submissions are stored with revision identifiers and related history.
- The latest valid files are selected for the final package.
- Client-accepted files become the completed output.

10.4 Notification Lifecycle

- A workflow action determines the next responsible role or person.
- The portal creates an unread notification containing the record and required action.
- The recipient opens the exact related workspace from the notification.
- After reading or acting, the notification can be marked as read.
- The next transition generates the next notification until the lifecycle completes.

End of feature and lifecycle overview.
